My Graduation Project about how to control fire .

The title is " IOT GSM SMART FIRE CONTROL SYSTEM "

The system can Detect the fire, smoke, higher temperature than normal, higher humidity and Gas leak .

Also it can give you warning notifications on the Blynk Application and your Gmail Account and the reason of the fire .

Also you can remotely control in all system using your mobile by your Blynk account on Application and know the state of the system.

And the most important part here the system in real time can disconnect/off the electricity and gas valve when any danger happen.
